## Crowns & Bridges

Crowns can be the ideal restoration for discoloured or broken teeth, or teeth that have been weakened by decay or large fillings.

We know how important your smile is to you and understand that you expect the best possible result.

We can offer the most up-to-date techniques and materials available such as zirconia crowns.

Zirconia is a high-tech ceramic and is considered to be cosmetically superior due to its translucency, durability, strength and overall natural appearance (compared to porcelain bonded to metal previously used for strength). Other metal-free crowns are also available.

Just like veneers, crowns can be used to give you that “wow” look and feeling.

Robin Warne, whose patients have been in the “10 Years Younger Magazine” with Nicky Hamilton Jones, has written several magazine articles and says it is one of the most life changing treatments you can have.

# Crowns & Bridges - Want A Natural, Even Smile?

A crown is a metal or porcelain 'hat' that fits over the tooth. It is usually made to repair a badly broken down tooth or to reshape a misaligned tooth. They can be made to build up individual teeth or multiple teeth and can be used in conjunction with veneers and implants and usually last a long time.

Pure gold used to be used to make crowns, but today we prefer to use either gold covered in porcelain or a material called Zirconia. Zirconia is a very hard porcelain with similar properties to gold for strength but is translucent and gives a more natural appearance.

If a tooth is badly broken and root filled, we often fit a post into the tooth to help strengthen it and hold the crown on better. Because metal does not flex, metal posts tend to break the tooth root which can lead to losing the tooth after a few years. Where possible, we use fibre posts, these have the same flexibility as the natural tooth root itself and leads to fewer root fractures and lost teeth.
