## Implants, Crowns & Bridges

**Implants - the most successful way to:**  
**Permanently restore gaps**  
**Permanently replace your missing teeth**  
**Permanently improve your smile**

### What are Dental Implants?

Implants are specially designed screws made of titanium which are placed into the jaw and act like natural tooth roots.

Replacement teeth can then be attached in the form of crowns or bridges filling any gaps and leaving you with the confidence to smile and eat what you like.

# Smile With Confidence

Implants are titanium roots that your own bone grows around. The titanium root or implant has a connector that joins the new tooth to the implant, this is called the abutment and it can be made from titanium or zirconia.

Teeth can be placed on implants at the same time as the old teeth are extracted, but sometimes it is better to wait a while for the implants to integrate. All options will be covered at the time of your examination.

Implants can be very natural teeth both in appearance and feel for the patient. Unlike dentures, implants are very secure and will not move. They will not damage the other teeth either, which is a problem when bridges are used to replace teeth.

The most natural appearance is achieved when the final tooth is made from zirconia as well as the connector between the implant and crown. Sometimes grafting is necessary to get the best fit and appearance of implant teeth.

Robin Warne has a Masters degree in Implant Dentistry. He can replace single or multiple teeth and is usually able to do any grafting necessary to give the best position and appearance for the implants. HDIC receives referrals from many other dentists.
