

Line Reducing Injections

After years of squinting, laughing, frowning, worrying and sometimes smoking, the skin around the eyes and on the forehead often develops deep lines and wrinkles.

These lines are called 'expression lines' and until now have been difficult to treat. Expression lines may often make you look older, tired, stressed or even angry.

Now, by utilising this muscle-relaxing agent, expression lines can be significantly reduced. Best of all, there is no "down time" - you can resume your regular activities immediately!

Line reducing injections not only help hide your age, but also alters the way people react to us. Without scowls and frowns people assume we are happy people. Other people like happy people!

Eliminate those lines and wrinkles!

Used over 100 years ago!

Today we use a purified protein from Clostridium botulinum (Botulinum toxin type A), as a non-surgical line and wrinkle treatment. First promoted in 1897 by Dr Scott, an American ophthalmic surgeon for its use of paralysing eye muscles that caused squinting. Its' side effects of reducing lines and wrinkles has overtaken its original use over the last 20 years and it is now used all over the world to make some of us look younger.

It works by blocking the message from the nerve to the muscle so that the muscle no longer contracts fully, the result is that the skin is not scrunched up and the creases reduce. If lines are already deep and well formed after years of scowling and frowning it might take a while for them to disappear, but even the most stubborn creases will 'soften' after treatment.

The commonest areas treated are forehead, glabella (area between the eyebrows) and crows feet although sometimes other areas of the face can be treated.

Treatment usually takes about 10 minutes and starts working after 3 to 4 days. Typically the effects will last about 3 to 4 months.

It is also sometimes successfully used in the treatment of migraines and stress headaches.

Please see our fee guide for further information.
